EE 16BT ECHIIO23 From plots, it can be observed that Chi-square is not subgaussian except when m -> 0 it will tend to gaussian. f(t) = sub (>t - log(E(e>x)) centred. $X = \begin{cases} 1 \\ 0 \end{cases}$, P^{-} $(-1)^{2} = x - p = (1 - p), p$ E(Y) = 0 $\Rightarrow E(e^{\lambda Y}) = e^{-\lambda P}(1-P+Pe^{\lambda})$ $=) f(t) = \sup_{\beta} (\lambda + + \lambda p - \log(1 - p + pe^{\lambda}))$ 8(2) = 0

$$\Rightarrow p + t - \frac{pe^{2}}{1-p+pe^{2}} = 0$$

$$\Rightarrow pe^{2} = (p+t)(1-p) + (p+t)pe^{2}$$

$$\Rightarrow pe^{2} = \frac{(p+t)(1-p)}{p(1-p-t)}$$
